

```
public class Account {  
    private int accountNumber;  
    private String accountHolderName;  
    private int balance;  
    private String location;  
}
```

Based on the above account class

Create a main class (AccountMain) which consist two operations

- 1) getAccountInput(); which reads the user value and assign Account object values
 - a. through set operations
 - b. through constructor
- 2) displayDetails() : Which prints the Account object values

```
public void getAccountsInput()  
{  
  
}  
  
public void displayDetails()  
{  
  
}
```

Note : follow all naming conventions
